```lua
-- Week 2, Activity 12:
-- a) Change the definition of numeral so that it can match floating-point
--    numbers like 0.1 and 13.25. It is up to you whether the syntax would also
--    accept things like 0. or .5 (You probably won't need to change anything in
--    the captures for this feature as all operations we used naturally handle
--    floats)
--
-- b) Add scientific notation ("E notation") to the previous definition, so that
--    we can write numbers like 0.5E-3 and 123e12 (Again, you probably won't
--    need to change anything in the captures)

local lpeg = require "lpeg"

         pc = pc + 1
      end
   end

   -- Tests:
   -- Get's the source code (only a number for now):
   local input = io.read("a")

   -- The frontend (parser) generates as AST:
   local ast = parse(input)
   print(pt.pt(ast))

   -- The backend (code generator) compiles AST to intermediate code:
   local code = compile(ast)
   print(pt.pt(code))

   -- We run the interpreter passing as arguments the
   -- intermediate code and the stack:
   local stack = {}
   run(code, stack)
   print(stack[1])
```
